

What is the difference between 4K TV and HD?

Last Modified on 11/25/2024 3:39 pm EST

The current standard for HD is 1080p, measured by the number of vertical pixels. 4K measures the horizontal pixels instead, and any TV described as 4K will have a resolution of at least 3840 x 2160. The result is a picture with about 8.3 million pixels, or about four times as many as a standard HDTV.
